

FINISH N

HELPING BRING YOUR CROP ACROSS THE FINISH LINE

FINISH N is 100% ammonium based fertilizer with potassium and sulfur that is fully stabilized from losing nitrogen to volatilization or leaching when used through irrigation pivots or Y-drop applications.

FINISH N is protected from above and below ground loss to make sure your nitrogen stays in the plant available ammonium form to help maximize growth and development during the late vegetative and reproductive periods in the corn plants life.

FINISH N also contains two carbon sources to help improve late season biological activity in the soil to help roots extract other key nutrients to maximize grain fill. Proper nitrogen fertilization and timing are crucial factors in modern corn production to maximize yield and quality while also managing the environmental impact these fertilizers have on water quality and the environment. Having the right form of nitrogen at the right time is important in corn production to help these modern day hybrids to maximize yield, especially during periods of high stress like hot/dry and cold/wet conditions.

BENEFITS

- < Contains 100% stabilized ammonium nitrogen the preferred form of nitrogen the corn plant needs to maximize kernel development and grain fill during V10 - R4 timing in corn.
- < Fully protected source of ammoniacal nitrogen from volatilization and leaching to keep nitrogen plant-available during irrigation and late season rain.
- < FINISH N contains fully available nitrogen and ammonium sulfate sulfur in a desired 6:1 N/S ratio to ensure these key nutrients plant available.
- < FINISH N also contains two carbon sources to improve nutrient uptake into the roots and increase overall nutrient utilization in the corn plant.
