

ONE JUG. ONE RATE. EVERY LOAD OPTIMIZED.

REDLOCK MAX takes the guesswork out of glufosinate programs – everything your spray water needs, premixed and ready to go.

WHAT IT IS

REDLOCK MAX is a premixed spray adjuvant engineered specifically for glufosinate-based herbicide applications. It combines a sulfur source, water conditioning, pH reduction, and carbohydrate-based plant energy into a single, ready-to-use formulation. No measuring separate products. No mixing at the nurse tank. Just pull the jug and go.

WHY IT WORKS

- Everything in one jug – sulfur, water conditioning, pH reducer, and plant energy are already combined at the factory
- Optimized for glufosinate performance – conditions spray water to give the active ingredient the best possible environment to work
- Consistent results load to load – premixed formulation eliminates variability from on-farm mixing
- Broad tank compatibility – works alongside glufosinate and other herbicides, insecticides, and fungicides

WHAT IT IS

When you mix water conditioners, pH reducers, and sulfur sources separately, you introduce variables: wrong rates, missed steps, loads that don't perform the same way twice. REDLOCK MAX removes those variables before the product ever reaches your operation. The formulation is done at the factory – locked in at the right ratios. You get the same optimized spray water every single load, without adding steps to your operation.

APPLICATION RATE

1 GAL

Per Acre / 128 fl oz

Single Rate. No Calculations Required.

PART OF THE REDLOCK FAMILY

COMPATIBILITY

Compatible with glufosinate and other herbicides, insecticides, and fungicides. Always read and follow label directions.

ORDER NOW

Contact your Redstar representative to add it to your program or place a pre-season order.
