REDLOCK

NEXT GENERATION POLYMER DRIFT CONTROL AGENT

Lessens the risk of drift and gives peace of mind while saving you money by getting more of your chemicals in the right place.

HOW IT WORKS

REDLOCK controls drift by making droplets heavier, without increasing droplet size. Instead, it creates more optimum-sized, consistent, and uniform droplets. Our drift control product drastically increases the percentage of spray that lands on target weeds, which results in improved coverage of both the upper and lower canopy.

ADVANTAGES

Our product has shown to be a complete solution as a nonionic surfactant, enabling droplets to stick to leaves and reduce runoff. In addition, it contains proprietary modified free-fatty acids that help carry the chemical into the weed for improved results. REDLOCK significantly slows the evaporation process, giving the chemical a greater time frame for uptake.

APPLICATION

The application rate is 1-4 quarts per 100 gallons, depending on wind speed, spray nozzles, sprayer pressure, and chemical being applied. See product label for complete usage rates.

- Delivers peace of mind with our Next Generation Polymer Technology.
- Creates optimum sized droplets.
- Slows evaporation increasing the time chemical has to work.
